

PHASE 4 - PROJECT PLANNING

Date :	27.09.2026
Team ID :	SWTID-2026-9496
Project Name :	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	5 Marks

Project Planning

The project is divided into several stages, including procurement process analysis, workflow design, request management, automation planning, approval configuration, and testing. Each stage is planned to ensure that the system meets the requirements of the IT procurement process.

Procurement Process Analysis

The first step in project planning is to analyze the existing IT procurement process for standard laptop orders. In a traditional procurement system, employees may need to submit requests manually, and IT staff may have to review, approve, and track each request separately. This process can lead to delays, repetitive work, and difficulties in monitoring order status.

The proposed system aims to overcome these challenges by introducing automation through ServiceNow Flow Designer. The procurement requirements are analyzed to identify the information needed for laptop orders, the people involved in the process, and the activities that can be automated. This analysis helps define the functional requirements and provides a clear understanding of how the automated system should operate.

Laptop Order Workflow Design

The workflow design phase focuses on creating a structured process for handling standard laptop orders. The workflow begins when an employee submits a laptop request through the ServiceNow Service Catalog. The submitted request contains the necessary details, such as employee information, laptop model, quantity, and request justification.

Automation Strategy

The automation strategy defines how ServiceNow Flow Designer is used to automate the laptop ordering process. Flow Designer provides a visual environment for creating workflows using triggers, conditions, and actions without requiring extensive programming.

Order Request Management

Order request management focuses on designing a simple and user-friendly interface for submitting standard laptop orders. The ServiceNow Service Catalog is used to provide a catalog item through which employees can request laptops.

Once the employee submits the form, the request is recorded in ServiceNow and made available for further processing by the automated workflow. Proper request management helps organize laptop orders and ensures that the required information is available during the procurement process.

Laptop Order Workflow Stages

S.No	Workflow Stage	Process Description	Expected Result
1	Request Submission	Employee submits a laptop request through the Service Catalog.	Request is created.
2	Flow Trigger	Flow Designer starts the workflow when the request is submitted.	Automated processing begins.
3	Request Processing	The flow processes the submitted request details.	Request is ready for approval.
4	Approval	The designated approver reviews the request.	Request is approved or rejected.
5	Status Update	The flow updates the request according to the approval decision.	Current status is recorded.
6	Notification	The system sends a notification about the decision.	Employee is informed.
7	Order Completion	The approved order proceeds through the configured completion process.	Request is marked completed when finished.

Expected Project Benefits

The proposed system is expected to improve the standard laptop procurement process by automating repetitive activities and providing a structured method for managing requests. Employees can submit laptop orders through the Service Catalog, while Flow Designer can handle the configured workflow actions automatically.

Overall, the project aims to provide a centralized and organized approach to standard laptop ordering. By using ServiceNow Flow Designer, the proposed system can make the

procurement process easier to manage and provide a foundation for further automation of IT procurement activities.
